A new immunogenic polypeptide has been developed comprising an immunogenic part of a soluble Mycobacterium tuberculosis antigen (or its variant differing only in conservative mubstitutions and/or modifications). The present sequence represents a Mituberculosis antigen, Therais. The immunogenic polypeptide can be used to diagnose Mituberculosis infection by forming complexes with specific antibodies in the sample, Fragments of DNA encoding the immunogenic polypeptide can be used as diagnostic primers or probes and agents that bind to the antigen,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New immunogenic polypeptide(s) from soluble M. tuberculosis antigens useful for diagnosis of M. tuberculosis infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Antigen; immunogen; vaccine; tuberculosis; non specific adjuvant; skin testing; M.tuberculosis.

A new immunogenic polypeptide has been developed comprising an immunogenic part of a soluble Mycobacterium tuberculosis antigen (or its variant differing only in conservative substitutions and/or modifications). The present sequence represents a M.tuberculosis antigen, TDRa35. The immunogenic protein, and fusion proteins containing one or more of the proteins or one of the proteins plus ESAT-6, are useful in vaccines, preferably when formulated with a non-specific adjuvant, to induce an immune response against M.tuberculosis (for treatment or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 300
                                                                                                                            This polypeptide comprises Mycobacterium tuberculosis soluble antigen ThRa35. It is encoded by a DNA sequence (see AAV44355) isolated from a M. tuberculosis strain H37Ra expression library with rabbit anti-sera raised against M. tuberculosis supernatant. No significant homology was found between TDRa35 and Genebank database sequences. The invention relates to compositions and methods for diagnosing tuberculosis. It provides polypeptides (see AAW64291 W64379) comprising an antigenic portion of a soluble M. tuberculosis antigen, or an immunogenic portion of an M. tuberculosis antigen, or an immunogenic portion of an M. polypeptides, recombinant expression vectors and transformed or transfected host cells. Also claimed are methods and diagnostic kits for detecting M. tuberculosis infection in a patient using the above polypeptides, antibodies or oligonucleotide probes and primers, for the diagnosis of tuberculosis. ```
The present invention describes polypeptides comprising an immunogenic part of a Mycobacterium tuberculosis antigen (Ag). Also described are vaccines and fusion protein containing M tuberculosis Ag's. Muberculosis and sending them, derived fusion proteins and other vaccines to generate a protective or therapeutic immune response to tuberculosis. Ag can induce profiferation of, or cytokine secretion by, T, B or natural killer cells and/or macrophages in tuberculosis-immune subjects. AdZ1949 to AAZ19460 and AAX39083 to AAX39225 are used in the exemplification of
                                                                                                                                                                                                                                                                                               New antigens from Mycobacterium tuberculosis useful in diagnostic skin tests and protective or therapeutic vaccines or compositions.
                                                                                                                                                                                                                                                                                                                                       Example 3; Page 108-109; 299pp; English

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       MSNSRRRSLRWSWLLSVLAAVGLGLATAPAQAAPPALSQDRFADFPALPLDPSAMVAQVA 60
                                                                                                                                                                                                                                                                                                     This invention describes novel recombinant antigens and their encoding nucleic acids derived from Mycobacterium tuberculosis. The novel polypoptides are useful for detecting M. tuberculosis infection in a biological sample by detecting antibodies which bind with the polypoptides, and are useful as vaccines for immunizing against M. tuberculosis infection. The new detection methods are needed as current vaccination strategies do not provide 100% immunity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             MSNSRRRSIRWSWLLSVLAAVGLGLATAPAQAAPPALSQDRFADFPALPLDPSAMVAQVA

M. tuberculosis antigen TbRa35 amino acid sequence.

(first entry)

AAY39109 standard; protein; 355

AAY39109

AAE29701

```
The sequence represents Mycobacterium tuberculosis TbRa35 (also known as Mtb32A), an M. tuberculosis antigen. Compositions comprising at least 2 feterologous antigens, as a fusion protein, and vectors expressing the fusion proteins are used as vaccines to prophylactically immunise mammals (especially humans) against infection by Mycobacteria. The compositions contain at least 2 heterologous antigens that increase the serological sensitivity of individuals infected with tuberculosis, a disease AIDS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Lodes ML;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Vaccinating against Mycobacteria infections in mammals using fusion proteins comprising combinations of heterologous antigens.

The invention relates to a recombinant nucleic acid molecule encoding a fusion polypeptide. The recombinant nucleic acid comprises a heterologous polymucleotide sequence encoding an antigen or an antigenic fragment from Mycobacterium sp. and a Leishmania polymucleotide sequence encoding a polypeptide or its fragment. The Leishmania polymucleotide is selected from TSA, LeIF, MIS, and 6H polymucleotides. Sequences of the invention are used in methods for eliciting immune response in mammals. They are microorganisms such as Leishmania and Mycobacterium tuberculosis. Fusion polypeptides are used for enhancing the expression of polymucleotides, as in vivo diagnostic agents and for raaksing antibodies in a non-imman and mimal. The invention is used in gene therapy. The present sequence is M. tuberculosis MTB32A antigenic protien. MTB32A is also referred to as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New recombinant nucleic acid molecule comprising a Leishmania TSA, LeIF, MIS or MIS or M polynuclectide, useful as vaccine to elicit protective immunity against pathogenic microorganisms e.g. Leishmania and Mycobacterium tuberculosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          181 QASDSITGABETLNGILQFDAALQPQBGGPVVNGLGQVVGMNTAASDNPQLSQGGGGFA 240

Mycobacterium species antigans, nucleotides encoding them and compositions comprising such fusion proteins. The present invention particularly relates to nucleic acids encoding fusion proteins that include two or more individual M. tuberculosis antigans which increase the serological sensitivity of sera from individuals infected with tuberculosis and methods for their use in diagnosis, prevention and useful for eliciting an immune response in a mammal, e.g., human, immunised with BCG. They are useful in the diagnosis, treatment and prevention of Mycobacterium infection. The fusion proteins and the mycobacterium, in vitro and in vivo assays for detecting humoral and antibodies or cell-mediated immunity against M. tuberculosis, for the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 diagnosis of an infection or monitoring of disease progression, as immunogens to generate or elicit a protective immune response in a patient and for raising anti-M. tuberculosis antibodies in a non-human animal. Sequences of the invention are also used as vaccines. MTB32A fusion proteins of the invention are useful as in vivo diagnostic agents for intradermal skin test. The present sequence is Mycobacterium species MTB32A (Ra32FL) protein
present invention relates to fusion proteins containing at least two

               from various Mycobacterium species microorganisms. The encoding nucleotide sequences can be used as primers and probes for methods for detecting and identifying mycobacteria, especially belonging to the M. tuberculosis complex. The encoded proteins can be used in vaccines for immunisation against a bacterial or viral infection

WPI; 2001-266299/27. N-PSDB; AAL40768 Recombinant nucleic acid molecule for producing high yield expression of desired fusion polypeptides, encodes fusion polypeptide comprising Mycobacterium tuberculosis coding sequence and heterologous polypeptide.

Disclosure; Fig 1; 39pp; English

The invention relates to a recombinant nucleic acid molecule encoding a fusion polypeptide, comprising a polymuclectide sequence of Ral2, a 14 kDa C-terminal fragment of serine protease antigen MTB32A of Mycobacterium tubercullosis, and a heterologous polymuclectide sequence. The recombinant fusion nucleic acids and polypeptides are useful for providing stable and high yield expression of fusion polypeptides of both eukaryotic and prokaryotic origin and to encode a protein product for use as an antigen for detecting serum antibodies. The presence of serum

antibodies to M. tuberculosis antigens in an individual indicates that the individual is infected with it. The fusion polypeptides are useful as sources of proteins for monitoring binding of serum antibodies to fusion proteins and as an immunogen to induce and/or enhance immune responses. The coding sequences can be ligated with a coding sequence of another molecule such as M. tuberculosis antigens, a cytokine or an adjuvant and can be used in vivo as a DNA vaccine. This sequence represents the Mycobacterium tuberculosis MTB32A protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1 MSNSRRRSLRWSWLLSVLAAVGLGLATAPAQAAPPALSQDRFADFPALPLDPSAMVAQVG 60

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention relates to a method for identifying a nucleotide or polypeptide sequence that may be a drug target, or essential for growth or viability of an organism. Polypucleotide sequences AAH51947 - AAH52092 represent DNA encoding proteins AAG81096 - AAG81241 Mycobacterium tuberculosis proteins which are potential drug targets. The DNA and protein sequences are used to illustrate the method of the invention. The method involves providing an unknown nucleotide or polypeptide sequences, and comparing it to a number of sequences along with at least one algorithm capable of analysing a functional relationship between nucleotide and polypeptide sequences. The method is useful for characterising the function of nucleic acids and polypeptides that may be useful as a target for a drug or essential for the growth or viability of
                                                                                                                                                                                                                                                                                                                                                                                         180

                                                                                                                                                          Mycobacterial DNA vectors containing reporter constructs - for identifying coding or promoter sequences involved in infection-associated
                                                                                                                                                                                                                                                                                                         Sequences AAY04742-Y05000 and AAY07201-Y07204 represent secreted proteins from various Mycobacterium species microorganisms. The encoding nucleotide sequences can be used as primers and probes for methods for detecting and identifying mycobacteria, especially belonging to the M. tuberculosis complex. The encoded proteins can be used in vaccines for immunisation against a bacterial or viral infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  120

ö The invention relates to a recombinant nucleic acid molecule encoding a bull this in polypeptide. The recombinant nucleic acid comprises a hererologous polymucleotide sequence encoding an antigen or an antigenic fragment from Mycobacterium sp. and Leishmania polymucleotide sequence encoding of polypeptide or its fragment. The Leishmania polymucleotide is selected from TSA, LeIF, MIS, and 6H polymucleotides. Sequences of the invention are used in methods for eliciting immune response in mammals. They are wiseful as vaccines to elicit protective immunity against pathogenic microorganisms such as Leishmania and Mycobacterium tuberculosis. Fusion polypeptides are used for enhancing the expression of polynucleotides, as in vivo diagnostic agents and for raising antibodies in a non-luman animal. The invention is used in gene therapy. The present sequence is M. tuberculosis mature Rais (N-terminus of MTB32A, RAISFL) antigenic protein New recombinant nucleic acid molecule comprising a Leishmania TSA, LeIF, MIS or 6H polynucleotide, useful as vaccine to elicit protective immunity against pathogenic microorganisms e.g. Leishmania and Mycobacterium GVVDNNGNGARVQRVVGSAPAASLGISTGDVITAVDGAPINSATAMADALNGHPGDVIS 307 93 NNHVIAGATDINAFSVGSGQTYGVDVVGYDRTQDVAVLQLRGAGGLPSAAIGGGVAVGEP 152 153 VVAMGNSGGGGGTPRAVPGRVVALGQTVQASDSLTGAEETLNGLIQFDAAIQPGDSGGPV 212 VNGLGQVVGMNTAASDNFQLSQGGQGFAIPIGQAMAIAGQIRSGGGSPTVHIGPTAFLGL 272 273 GVVDNNGNGARVQRVVGSAPAASLGISTGDVITAVDGAPINSATAMADALNGHHPGDVIS 332 128 VVAMGNSGGQGGTPRAVPGRVVALGQTVQASDSLTGAEETLNGLIQFDAAIQPGDSGGPV 187 33 APPALSQDRFADFPALFLDPSAMVAQVAPQVVNINTKLGYNNAVGAGTGIVIDPNGVVLT 92 8 APPALSODRFADPPALPLDPSAMVAOVGPOVVNINTKLGYNNAVGAGTGIVIDPNGVVLT 67 0; Gaps Query Match 90.7%; Score 1634; DB 5; Length 330; Best Local Similarity 99.4%; Pred. The present invention relates to fusion proteins containing at least two Mycobacterium species antigens, nucleotides encoding them and compositions comprising such fusion proteins. The present invention particularly relates to nucleic acids encoding fusion proteins that invention particularly relates to nucleic acids encoding fusion proteins that include two or more individual M. tuberculosis antigens which increase the serological sensitivity of sera from individuals infected with tuberculosis and encoded for treatment of tuberculosis infection. Sequences of the invention are useful for eliciting an immune response in a mammal, e.g., human, immunised with BCG. They are useful in the diagnosis, treatment and provention of Mycobacterium infection. The fusion proteins and the polynucleotides are useful as diagnostic tools in patients infected with Mycobacterium, in vitro and in vivo assays for detecting humoral antimediated immunity against M. tuberculosis, is an infection or monitoring of disease progression, as immunogens to generate or elicit a protective immune response in a immunity along in the invention are also useful as in vivo diagnostic an infection or monitoring or disease progression, as immunity and proteins of the invention are also useful as in vivo diagnostic fusion proteins of the invention are also useful as in vivo diagnostic and infection or monitoring as in vivo diagnostic and an infection or monitoring as in vivo diagnostic and agents for the diagnostic and an infection are also used as vaccines. With a protein and also proteins of the invention are also used as vaccines. 93 NNHVIAGATDINAFSVGSGGTYGVDVVGYDRTQDVAVLQLRGAGGLPSAAIGGGVAVGEP 152 Composition comprising MTB39 antigen and MTB32A antigen from Mycobacterium species, useful for eliciting immune response in a subject for intradermal skin test. Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                       Noone D., Howell A., Collery R., Devine K.M.;

"YkdA and YvtA, HtrA-like serine proteases in Bacillus subtilis,
angage in negative autoregulation and reciprocal cross-regulation of
angage in negative autoression."

"I Bacteriol. 183:654-663(2001).

"I FUNCION: May be involved in processing, maturation, or secretion
of extracellular enzymes.

"I SUBCELLUIAR LOCATION: Membrane-bound (Potential).

"INDUCTION: Induced by heat shock during exponential growth and by
heterologous amylases at the transition phase of the growth cycle.
Negatively regulates its own expression.

"MSCELLANEOUS: Inactivation results in compensating overexpression
of htrA, especially during stress conditions.

"I SIMILARITY: Balongs to peptidase family S2C.
"SIMILARITY: Contains 1 PDZ/BHR domain.
"I CAUTION: Ref.2 and Ref.3 sequences differ from that shown due to
frameshifts in positions 87 and 246 that produce two separate
ORFS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This SWISS-PROT entry is copyright. The complete genome sequence of Escherichia coli K-12.";

Science 277:1453-1474(1997).

C -!- FUNCTION: PROTEASE WITH A SHARED SPECIFICITY WITH DEGP/DEGP.

C -!- SUBCELLULAR LOCATION: Periplasmic.

-!- SUMILARITY: Belongs to peptidase family S2C.

C -!- SIMILARITY: Contains 2 PDZ/DHR domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Waller P.R., Sauer R.T.; "Characterization of deg0 and deg8, Escherichia coli genes encoding homologs of the DegP protease."; J. INVOLVED IN THE DEGRADATION OF DAMAGED PROTEINS. SHARED SPECIFICITY WITH HOA/DEGO.
-i - SUBCELLULAR LOCATION: Periplasmic.
-i - INDUCTION: By heat shock.
-i - SIMILARITY: Belongs to peptidase family S2C.
-i - SIMILARITY: Contains 2 PDZ/DHR domains.

"Molecular characterization of a stress-inducible gene from "actobacillus helveticus.";
J. Bacteriol. 180:6143-6153(1998).
-!- SUBCELLULAR LOCATION: Membrane-bound (Potential).
-!- SIMILARITY: Belongs to peptidase family $2C.
-!- SIMILARITY: Contains 1 PDZ/DHR domain.
                                                                                                                                                                                                                                                                                                                                                                                                                            307 VDGAPINSATAMADALNGHHPGDVISVNWQTKSGGTRTGNVTLAE 351

INVOLVED IN THE DEGRADATION OF DAMAGED PROTEINS. IT CAN DEGRADES ICIA, ADA, CASEIN AND GLOBIN. SHARED SPECIFICITY WITH DEGO. SUBUNIT: Multimeric.
 Hydrolase, Serine protease, Heat shock; Periplasmic, Repeat, Signal;
 -!- SUBUNIT: multiples.
-!- SUBCELLUIAR LOCATION: Periplasmic.
-!- INDUCTION: By heat shock.
-!- INSCELLANBOUS: HTAA IS INDISPENSABLE FOR BACTERIAL SURVIVAL AT TEMPERATURES ABOVE 42 DEGREES CELSIUS.
TEMPERATURES ABOVE 42 DEGREES CELSIUS.

 ANULATION. V.F.;

The movel two-component regulatory system in Bacillus subtilis for the survival of severe secretion stress.",

Burvival of severe secretion stress.",

Mol. Microbiol. 41:1159-1172(2001).

C. I. FUNCTION: Way be involved in processing, maturation, or secretion of extracellular enzymes.

C. I. SUBCELULAR LOCATION: Membrane-bound (Potential).

C. I. SUBCELULAR LOCATION: Membrane-bound (Potential).

C. I. SUBCELULAR LOCATION: Membrane sess dependent. Induced by heat shock during exponential growth and by heterologous amylases at the transition phase of the growth cycle. Negatively regulates its own expression during exponential growth and during heat shock.

C. I. MISCELLANEOUS: Inactivation results in compensating overexpression of ytvà, especially during stress conditions.

C. I. SIMILARITY: Belongs to peptidase family $2C.

C. I. SIMILARITY: Contains I PDZ/BIR domain.
